

Cell fusion free varieties in vegetable production

Mandatory and recommended varieties

Organic farming aims to preserve the integrity of the plants and respect crossing barriers in breeding. The use of varieties bred in a pollen-sterile manner by means of cell fusion is therefore controversial in organic farming. The organic farming associations in Germany, Austria and Switzerland reject this breeding and propagation technique.

The present list includes all available varieties of cabbage, chicory, radicchio types, sugar loaf and root parsley that are not based on cytoplasmic male sterility (CMS) transferred by means of cell fusion. The list is binding for producers of Bioland, Naturland, Demeter and Bio Austria. Producers of Bio Suisse are not allowed to use cell fusion-bred varieties with the exception of cauliflower, broccoli, white cabbage, savoy cabbage and chicory.

Principle and procedure

In the long term, the organic farming associations want to promote the availability of varieties that have been produced without critical breeding procedures. By publishing a common list of cell fusion-free varieties for vegetable cultivation and regularly updating the list, they maintain regular contact with the breeding companies and communicate their concerns to the companies involved.

At the same time, the organic farming associations want to provide their members with a resource that enables them to select cell fusion-free varieties with the greatest possible certainty when making choices. The associations have knowledgeable contact persons available to answer questions about cell fusion-free varieties. The list is updated annually.

Cell fusion – what it is about

For efficient hybrid breeding, the mother line must not self-pollinate. In many plant species, the naturally occurring cytoplasmic male sterility (CMS) is used for this purpose.

In cabbages and lettuces of the Cichorium group such as chicory, radicchio and sugarloaf, no natural CMS has been observed so far. Therefore, instead of CMS, breeders use the natural self-incompatibility (SI) system, in which the plant's own pollen does not grow or grows slowly on the stigma, whereas foreign pollen grows faster. Since the SI system cannot avoid self-pollination by 100 per cent and is dependent on temperature and other factors, CMS was transferred to cruciferous and chicory species in the 1970s using cell fusion. In this way, a higher degree of hybridisation was achieved in seed production of F1 hybrids.

More information on cytoplasmic male sterility can be found in FiBL's dossier «Plant Breeding Techniques» at shop.fibl.org > 1202 [direct link].

Association-specific regulations

The organic farming associations Bioland (DE & IT), Naturland (DE), Bio Austria (AT) and Demeter (DE & CH) prescribe the use of cell fusion-free varieties. Currently, cell fusion-based CMS is used in vegetable production for cruciferous plants (Brassica species), for some chicory species (chicory, radicchio and sugar loaf) and for root parsley. The **present list is binding** for producers of these associations. Since 2019, producers of Bio Suisse are no longer allowed to use varieties from cell fusion breeding, with the exception of cauliflower, broccoli, white cabbage, savoy cabbage and chicory.

If producers of these associations **use only varieties from the current list** at the time of ordering, they have fulfilled their duty of care regarding the use of cell fusion-free varieties.

If a variety is not on the list, producers are asked to contact the contact person of their association.

The list also serves as a reference for the inspectors when checking the cultivated varieties during the annual farm inspection.

Confirmed cell fusion free varieties

The list contains all cell fusion-free varieties of cabbage, chicory (*Cichorium intybus*) and root parsley known to the organisations. The listed varieties have at least one of the following assurances for absence of cell fusion:

- Confirmation as open-pollinated, seed-solid variety (OP), e. g. according to the EU list of varieties or information provided by the breeder
- Written assurance from the breeder
- Flower morphological observation by a breeding expert
- Quantitative PCR analysis of seeds from a sealed original seed package; or
- Expert knowledge

EN: The breeder or the company that has applied for the variety to be included in the EU list of varieties is usually indicated in brackets. In the case of conservation varieties, the most important propagator or «diverse» is listed in brackets as an endorsement. Especially for OP-varieties the spelling may vary slightly. In the case of chicory cultivars, the type (e.g. Chioggia, Treviso, Grumolo) stands behind the variety in square brackets.

* Varieties with a * are not (or no longer) on sale.

F: Le nom du sélectionneur ou de l'entreprise qui a inscrit la variété sur la liste des variétés de l'UE est généralement indiqué entre parenthèses. Pour les variétés de conservation, le multiplicateur le plus important ou « divers » a été indiqué sous forme de note. L'orthographe peut varier légèrement, surtout pour les variétés OP. Pour les cultivars de chicorée, le type (par ex. Chioggia, Treviso, Grumolo) est écrit entre parenthèses après la variété.

* Les variétés marquées d'un * ne sont pas (ou plus) en vente en Suisse.

I: Tra parentesi è generalmente indicato il nome del selezionatore o dell'impresa che ha

iscritto la varietà al catalogo delle varietà dell'UE. Per quanto riguarda le miscele di sementi per la preservazione, tra parentesi è indicato il principale moltiplicatore o la menzione «diversi». Specialmente per le varietà OP, la grafia può leggermente variare. Per le cultivar di cicorie, il nome della varietà è seguito dal tipo (p. es. Chioggia, Treviso, Grumolo) indicato tra parentesi.

* Le varietà contrassegnate da un asterisco (*) non sono (più) in vendita.

ES: El seleccionador o la empresa que ha solicitado la inclusión de la variedad en la lista de variedades de la UE suele indicarse generalmente entre paréntesis. En el caso de las variedades de conservación, se indica entre paréntesis el multiplicador más importante o «diverso». Especialmente, en el caso de las variedades a polinización abierta (OP), la grafía puede variar ligeramente. En el caso de las variedades de achicoria, el tipo (por ejemplo, Chioggia, Treviso, Grumolo) se escribe entre paréntesis después de la variedad.

* Las variedades con un * no están (ya) a la venta.
